Anna

GYR-O PAGES · WORLAND HIGH SCHOOL

Anna · a page of your own

WHO IS ASKING

I am a senior at Worland High School. I am showing local businesses what a website of their own would look like, and writing down what they think of it. Nobody is selling anything today.

This page is one. Everything you are looking at — the answers here, the sources in the middle, the working detail on the right — is the same format your page would be built in.

free to have one · a dollar a month for your own name · no subscription · no tracking

THE PAGE LAYOUT BELOW IS STANDARD ON EVERY GYR-O SITE

A PLAIN ANSWERS ✓

– What am I looking at?

A page built the way yours would be built. One topic, one page, and every claim on it carries the source it came from — the column in the middle.

It loads in under a second on any telephone, including out at a job site. It has no analytics, no trackers and no cookies. Nothing on it is watching you.

Tap whichever fits you. Both companies are invented and say so across the top. Everything else on them — the insurance rules, the safety standard, the county's crops and water, the State of Wyoming's own verification — is real and sourced. Both are previewed in the middle column: the tree service[1] and the farm[5].

A trade — tree service →

Insurance first, because that is what a stranger most wants to know and least likes asking. Tap the verification button yourself; that is the part worth seeing.

A farm — hay and beef →

What is for sale, what hay costs, how buying a quarter of beef actually works, and why you cannot just buy a steak.

– What would mine look like?

The same shape, with your answers in it. The questions a customer actually asks you, answered plainly, in the order they ask them.

For a trade, the first answer is usually insurance, because that is what a stranger most wants to know and least likes asking. For a shop it is hours and what you carry. For a farm it is what is for sale and when.

You would not write it. You would talk, and someone would write it down and show it to you until it was right.

– What does it cost?

Nothing, to have one. The hosting is free and stays free — there is no subscription, no platform fee and no bill of any kind[2]. The address would look like `washakieai.github.io/yourfarm`.

About a dollar a month, if you want your own name on it — roughly twelve to fifteen dollars a year for something like `eastbenchfarm.com`, paid to whoever sells you the name and to nobody else.

That second one is worth saying plainly, because it is not only about looks. **The name is the part you actually own.** With your own name you can pick the whole thing up and move it anywhere; on the free address you cannot, because the address belongs to the company hosting it[4].

So: free to find out whether you want one. A dollar a month when you decide you do.

For the pilot program the building is free as well[3]. If it goes ahead, the first businesses pay nothing at all.

– Do I own it?

The name and the words are yours outright. That is the honest answer, and it is unusual enough to be worth saying plainly.

The page is a handful of plain files. If you ever want to move it, you take the files and the address and go — there is nothing to export and nobody to ask. On a social page you cannot do that: the address was never yours and the audience does not come with you[4].

– Why is a high school student asking me this?

Because nobody has built one of these for a Worland business yet, and before anyone asks the county to pay for twelve of them, somebody ought to find out whether businesses here actually want one.

That is what today is. I show you the example, you tell me what you think of it, and I write down what you said. It goes on a list that decides whether the program happens [3].

There is nothing to sign and nothing to buy. If you think it is useless, that is worth knowing too, and I will write that down just as carefully.

– What happens to what I tell you?

It stays in this telephone until the end of the day, and then it goes to Walter Wilkinson in Worland, who is running this. It is not uploaded anywhere as we speak and nobody else sees it.

You decide whether your name is on it. I will ask you outright. If you would rather not be named, the list says “a business on Big Horn Avenue” and your answers still count.

B SOURCES ✓

HOW TO READ A CARD

Every card below reads the same way, top to bottom. Parts 4 and 5 are the ones a bare footnote never gives you.

1. **Number and kind** — what sort of thing it is
2. **Title** — what it is called
3. **Provenance** — who made it, when, under what license
4. **Preview** — what you would find if you went there
5. **Why it is cited** — what it is doing on this page
6. **The link** — last, and only last

INTERNAL LINKS

The two most recent content changes, and the record behind them.

26 September 2026 — the call is recorded in column C

The working side of the page, where the five questions live. A customer has no reason to go there; the student does, once the conversation is over.

26 September 2026 — built as an instance, not as a form

The first draft was a plain input form in the right colors. It demonstrated nothing. This one is the format, with itself as the subject, which is the whole argument.

EXTERNAL LINKS

Every reference to some other website, previewed. The link is always the last line — read the card first and decide whether you need the round-trip distraction of visiting the original at all.

1 EXAMPLE · WHAT A PAGE LOOKS LIKE

Bighorn Basin Tree Service

gyro-sites.online · a sample, marked SAMPLE across the masthead

An invented Worland tree service, built exactly as a real one would be. The insurance is the first thing on the page rather than a line in a brochure, and every part of it links to somebody else’s check: the State of

Wyoming for the workers' compensation, the arborists' own register for the credential.

Why it is cited: it is the thing being demonstrated. Everything column A claims about a page of your own is easier to see there in thirty seconds than to read here.

→ gyro-sites.online · the tree service sample

5 EXAMPLE · THE SAME FORMAT, A FARM

East Bench Pivot Farm — hay and beef, east of Worland

gyro-sites.online · a sample, marked SAMPLE across the masthead

An invented Washakie County farm selling hay by the bale or the ton and beef by the quarter. Answers the questions a buyer actually asks: what hay costs, why certified weed-free matters, how a quarter of beef is cut and what it weighs when you get it home, and why a farm cannot sell you a single steak. Sixteen sources behind it — the county's real crops, water and rules.

Why it is cited: a rancher shown a tree service page has to do the translating. Showing the farm instead removes that step, and the two together make the point that the format is not about one trade.

→ gyro-sites.online · the farm sample

2 METHOD · HOW IT IS BUILT AND WHAT IT COSTS

GYR-O Pages — the format, published free

gyro-sites.online · the written method anybody can follow

Sets out the whole format: one topic, one page, plain answers on the left, every source previewed in the middle, technical detail on the right. Records what it costs to run, what it cannot do, and the things that went wrong in building it. The method itself is given away, so the thirteenth site costs nobody anything.

Why it is cited: the cost figure in column A comes from there, and so does the claim that there is no subscription. Both are checkable without taking a student's word for them.

→ gyro-sites.online

3 PROPOSAL · WHO WOULD PAY, AND WHAT FOR

Washakie AI — a twelve-month pilot program

washakie-ai.online · a grant proposal, not yet awarded

Asks $10,000 for twelve working websites for Washakie County institutions and small businesses, four public workshops, and a written method anybody can follow afterward. Names its own risks, including the

one this page exists to test: whether enough local businesses actually want a site to make the program worth running.

Why it is cited: it is the reason a student is at your door. The answers collected today go into deciding whether it is asked for at all.

```
→ washakie-ai.online
```

4 TERMS · WHAT YOU KEEP ON A SOCIAL PAGE

Do you really own it? — Page F

gyro-sites.online/legal.html · the platforms' terms, read and quoted

Takes ownership apart across Facebook, Twitter, a website builder and a site like this one, quoting each platform's own terms. On every arrangement you keep copyright; what changes is the license you grant to publish, and what you are able to leave with. The decisive column is the last one: on a platform there is nothing to leave with, because the address was never yours.

Why it is cited: column A claims you would own this outright, which is only an honest claim if the comparison is shown rather than asserted.

```

```

C HOW IT WORKS (DETAILS) ✓

Prior know-how is assumed here, and the items become more technical toward the bottom. This column is the student's working side: the call is written down here, once the conversation is over.

The call

Fill this in after you have shown them the example, not during. Everything stays in this telephone until you send it.

Show the one that fits. The farm page for anyone selling hay, beef, grain or ground; the tree service for a trade, a contractor or anyone whose customers worry about insurance. Showing a rancher a tree service page makes them do the translating, and some of them will not bother.

Business

Name of the business

Who you spoke to

Name, or their job

1. Do they have a website now?

☐ None ☐ Facebook only ☐ Yes, out of date ☐ Yes, current

2. Having seen it — would they want a page like that?

☐ Yes ☐ Maybe ☐ No

3. What would they most want on it?

☐ Hours & contact ☐ Prices ☐ Licenses & insurance ☐ What we do ☐ Photographs

4. Would they talk to someone about building one?

☐ Yes ☐ Not now

5. May we name them on a list of interested businesses?

☐ Yes ☐ No

Anything they said worth keeping

> **Where this lives.** Every answer is held in this telephone's own memory and nowhere else until you tap send. There is no server behind this page — that is true of the whole format, and it is why the call sheet had to be built this way rather than as a form that posts somewhere. Send at the end of each day: if the telephone is wiped first, they are gone.

Working with no signal

The page registers a small service worker that keeps a copy of itself, the icons and the portrait in the browser's cache. Once it has been opened with a signal, it opens again without one — in a shop with thick walls, in a shed, out past Ten Sleep. Every fetch also refreshes the cache quietly in the background, so a republished page is picked up next time rather than being stuck forever behind a stale copy.

Deliberately, the page loads *no web fonts*. The rest of this family uses IBM Plex Mono and Source Serif; this instance uses whatever the telephone already has. A typeface that arrives over the network is one more thing that fails at the moment it is needed.

The icon with her name on it

Opened in a browser and added to the home screen, this page gets an icon of its own carrying the student's name, and opens full-screen with no address bar. That is a web app manifest — about forty lines — and not an App Store application: no developer account, no review, no annual fee. Functionally it is theirs; it simply was not downloaded from Apple.

The icon artwork keeps everything inside the middle eighty per cent of the square, because Android crops a maskable icon to a circle and would otherwise take the name off the bottom.

The paper fallback

Printed, this column becomes the same five questions blank, with ruled lines to write on and every button, tally and saved call left off the page. A telephone runs out of battery. Paper does not.

Why this is an instance and not a form

The first version of this page was a plain input form in the format's colors. It worked, and it demonstrated nothing: a student holding it out was showing a questionnaire, not a website. Walter caught it in one line — *"I had in mind an instance of 3Col."*

Built this way the page argues for itself. The owner reads column A while the student holds the telephone; the sources are one tap away in column B if they want to check anything; and the working machinery sits in column C where a customer has no reason to wander. The demonstration and the tool are the same object.
