GYR-O Pages and the AI Site Builders, Side by Side

The leading AI builders make apps. GYR-O makes one sourced, self-contained page that its owner keeps. They serve different jobs; this table shows where each fits.

	GYR-O Pages	Lovable	Bolt.new	v0 (Vercel)	Framer
What it builds	One single-topic site: plain answers, sources and details in three columns	Full-stack web apps (React front end, Supabase database)	Websites and app prototypes in a browser IDE	React / Next.js interfaces and pages	Designed marketing sites
Who it's for	A local business, farm, club or researcher with one subject to explain	Non-technical founders building a product	Developers and fast prototypers	Front-end developers	Designers and marketers
Running cost	Hosting free (GitHub Pages); domain about $10–20 a year; Claude used only while building or editing	Free tier; paid plans from about $20 a month	Free tier; paid plans	Free tier; paid plans	Free single page with Framer branding; paid plans
Who owns and hosts it	The owner: plain files in the owner's own GitHub account, readable by any browser, movable to any host	Hosted by the platform; code can be synced to GitHub	Hosted by the platform; code can be exported	Deployed to Vercel; code in the owner's repository	Hosted by Framer
Every claim sourced	Built in: each claim links to a source card that previews the source and says why it is cited	Not a built-in feature; possible only if the author writes it in			
Attack surface	None to speak of: no server program, no database, no logins, no forms	A live app and database to secure and maintain	Depends on what is built; apps carry a backend		Hosted site with forms and integrations
Tracking	None: no cookies, no analytics	Varies by site; analytics commonly added			
Works offline, archives intact	Yes: previews are baked into the page, nothing is fetched while reading, and an archived copy still works	Generally no: pages depend on live servers and scripts			
Reader in control	Intro / Info and column switches: the visitor decides how much is on screen, remembered on their own device	Whatever the author designs			
Print and PDF	Every site prints whole, and ships a prebuilt PDF	Not standard			
Skill needed	A short description of the subject; a local Site Builder does the setup once	None to start; more for anything custom	Some	Developer	Designer
Best when	The job is to explain one subject truthfully, cheaply and permanently	You are building a product with users and data	You want a working prototype fast	You need polished React UI	You need a striking marketing site

Fairness note. The four builders are strong at what they do, and Lovable and Bolt run on the same family of Claude models GYR-O is built with. The comparison is about the job, not the quality of the tools: an app builder is the wrong tool for a page that must stay true, cheap and readable for years, and GYR-O is the wrong tool for an app.

Market facts: Lovable reported at $200M annual recurring revenue in 2026 (kapernikov.com roundup); pricing from nxcode.io's 2026 comparison and vendor pages; Bolt's use of Claude Sonnet and Opus from beebom.com. Builder ranking lists are often vendor-written; treat the order loosely. Prepared November 2026.
